

Distributing Groups of Objects

If your screen contains several objects placed in different positions and you need to place them on the screen so that they are evenly distributed in relation to each other's positions or to the size of the screen, Nimbus allows you to do this with one action which will apply to all the objects selected.

Start by selecting all the objects you want to distribute. Keep the **Shift** key pressed on your keyboard while you click on all the objects you want to distribute.

When several objects are selected, options to distribute will be available in the **Tools** toolbar.

Place a tick in the **To Screen** box if you wish to distribute the objects to the screen, rather than the selection boundaries of the selected objects.

At this point you can select to distribute the selected objects vertically or horizontally. The Distribute Horizontally button will evenly distribute the objects horizontally between the left and right edges of the object boundaries / screen.

The Distribute Vertically button will evenly distribute the objects vertically between the top and bottom edges of the screen.
